

Hi,

1. I would like you to build me an app as described below:
2. The app is Tinder style (Swipe left and right).
3. The idea of this app is dating app, but only for students.
4. First, the user will be able to register only with a student email account and after verification, will be able to connect either an email or with Facebook account.
5. After user logged in he will get images of those people close to him. By default it will be 50 KMs, but will be able to change it.
6. This app have to support GPS location or get location by IP address from IPS provider.
7. The user will have to upload at list one photo, otherwise he, we will pull a photo from his collage account – not sure if it possible.
8. I want the app will not look exactly like a tinder app, there for I'll be needed a developer with a creative mind that can understand the needs and of course will come up with ideas.
9. I want the user be able to choose his screen with photos order by:
  - a. List
  - b. Grid view
10. I will have a bar which be located on right side of the screen and will be collapsed and expand whenever the user clicks it.
11. The user will have the following buttons:
  - a. User Profile
  - b. Photos
  - c. Chat – will contain all the chats
  - d. Likes
12. When user sees the photo it will show:
  - a. Whether the user is online or not.
  - b. When the user was online
13. The user will be able to choose his preferred swipe (e.g. – left to right or top to bottom).
14. A push notification must – Will send a message, email or push a notification over the screen. The user will be able to choose one, none or all the options
15. Specs for the developer:
16. Server side based on .net or something easy to maintain.
17. Database based on mongo not a must but a preferred one.
18. Do I need some other things to make this app running?
19. I want to publish the app on app-store and google play when it will be ready.
20. I want the source-code, so I'll open a gitlab repository and send you user name and password
21. The app must support RTL, so a json with translation is a must
22. I can ask for some designs for the beginning but again, I want a developer with open mind that can do some great things.
23. I will be needed some admin pages to remove, block users etc.
24. The app should be with angular base on front-side.

Thanks,

Waiting for you reply,

Nathan
